

## Power plant connection

The power plants can be connected to the grid in two ways:

When configuring the power plant, select

- **in:** serial (**internal**) with grid power sensor
- **ex:** parallel (**external**) with grid power sensor

The power plants are configured as internal by default.

## PV inverter

Obtaining relevant data from photovoltaic is possible by two ways:

1. adding power-sensor to measure produced electricity by PV (no connection to interver) - on how to add power sensor please see [Power Sensor](#)
2. connecting PV inverter by Modbus TCP to EVSE (only for SolarEdge inverters)

## EVSE and PV inverter connection

To add inverter on HEMS configurator:

- on settings page inside source table, select SolarEdge inverter. Please see [settings](#)
- on io mux page define IP address for inverter. Please see [io\\_mux](#)

To setup Modbus TCP on Inverter using SetApp:

- Select Site Communication menu
  - RS485-1 → Protocol → SunSpec (Non-SE Logger)
  - RS485-1 → Device ID, and enter the number 1
  - Modbus TCP and set to Enable
  - set TCP port to 502

Note:

The TCP server idle time is 2 minutes. In order to leave the connection open, the request should be made within 2 minutes.

---

It is important to follow rules above, firstly to set HEMS configurator following Inverter setup.
